Description

Types 8344, 8344-B-001 and 8344-B-002 are piezoelectric accelerometers designed and optimized for low-frequency and low-level measurements. They feature low-noise, built-in CCLD* preamplifiers with TEDS and are based on Brüel & Kjær's patented DeltaShear design.

The DeltaShear design consists of three piezoelectric elements and three seismic masses arranged in a triangular configuration around a triangular centre post. They are held in place by a clamping ring that isolates the configuration from the base. The ring also prestresses the piezoelectric elements to give a high degree of linearity. This design provides a high sensitivity-to-mass ratio, a relatively high resonance frequency and high isolation from base strains and temperature transients.

The piezoelectric element used is PZ 27, zirconate lead titanate, and the hermetically sealed housing is made of stainless steel, AISI316-L, and has an M5-threaded hole for mounting on the base.

Characteristics

The built-in CCLD preamplifier requires that the accelerometers are supplied with a constant current and treated as a voltage source. The sensitivity is expressed in terms of voltage per unit acceleration (mV/ms^{-2}).

* Constant current line drive, also known as DeltaTron® (ICP and IEPE compatible)
